

Westfield Intermodal Facility Westfield, Massachusetts

Description

As part of a project team selected to plan and design an intermodal transportation center in Westfield, Massachusetts, FHI was responsible for portions of the Environmental Assessment. FHI carried out traffic, air quality, and noise impact analyses for this interesting intermodal project that also involved joint development with a hotel and several additional community uses including a police substation. The traffic impact analysis involved evaluating parking demand, local roadway level of service impact, and pedestrian movement and was particularly challenging due to the addition of joint development and to simultaneous removal of other development from the project site. FHI was also involved in review of preliminary site plan design for traffic circulation and pedestrian amenities.

Client

Pioneer Valley Transit Authority
