

**Governor's Highway Industrial Subdivision
South Windsor, Connecticut**

Description

FHI was tasked with conducting a traffic study to assess the potential impacts of a proposed 17-acre industrial subdivision in South Windsor, Connecticut. The site traffic generated by the development was estimated and distributed onto the local roadway network via a series of multiple site driveways and a proposed cul-de-sac street. Both pre- and post-development levels of service were calculated at nearby signalized intersections with state routes. Appropriate mitigation measures were recommended following an assessment of the impact of the development. FHI also addressed an issue of truck traffic traveling through a nearby residential neighborhood.
